

Grade 8 Science - Local Development Seed Notes

The Water Cycle

The water cycle is the continuous movement of water on Earth.

Evaporation turns liquid water into water vapour using heat from the Sun.

Condensation turns water vapour back into tiny liquid droplets, forming clouds.

Precipitation is water that falls from clouds as rain, snow, or hail.

Collection is when fallen water gathers in oceans, lakes, and rivers.

States of Matter

Matter exists in three common states: solid, liquid, and gas.

A solid has a fixed shape and a fixed volume.

A liquid has a fixed volume but takes the shape of its container.

A gas has neither a fixed shape nor a fixed volume and fills its container.

Melting is the change from solid to liquid; freezing is liquid to solid.

Boiling is the rapid change from liquid to gas at the boiling point.
